90-Second Live Demo -- One Screen (DEMO_SCRIPT_90S.md)

Order required by the brief: 90 s of Scenario B with the jury's priority file, then Scenario A with the jury's card. Everything runs on the laptop (./run_demo.sh, opens http://127.0.0.1:8765/ -> single screen). No slides. The legacy engineering console stays at /console/ as backup.

The screen (one view, no scrolling)

Zone	What it proves
Ship schematic (centre)	Bays 1/2, hangar, hangar roof, flight deck, mast slots M1-M3, stern ramp, labelled with occupant and mode (A.3). 3D is only the drawing; it earns nothing on its own.
Eight gauges (right)	A.1 power (Line A/B), A.2 cooling C(T), A.3 positions and mast, A.4 mass/stability, A.5 data links, A.7 compute, A.8 response time. The binding class turns red. Forecast chip ? ~39 s ? WARN is advisory only (C').
Decision log (bottom left)	One sentence per decision, from the binding constraint; the forecast advisory line sits on top.
Tabs (bottom right)	Jury test ? A (card, water temperature, generators, wind, sea state, port/sea), Shocks ? D4/C, Priority ? D6 (same run, two priority files side by side).
Header	Live engine chip, mission clock, Golden Gate public data (SST, wind, Hs, sea state, A' deck window), Priority Survey/Rescue/Custom, Crew 14/6/0, deck clear.

Script

Wall clock	Action	Say / point at
00:00-00:10	Header: pick the jury's priority (Survey or Rescue).	"Scenario B: G1+G3+G4+G5, 9.56 t of 10 t, 3 kn over a cable route, 24 deg C; eight gauges steady."
00:10-00:35	Play 90 s Scenario B (20x). At T+08:00 the log shows the D3 decision.	"Drone at 18 %, wind 22 kn: land within 12 min or ditch. Survey primary: G3 finishes 240 s, holds at T+12:00, G4 lands T+18:15, cost 14 min. Decided in milliseconds (budget 2 s)."
00:35-00:55	T+12:00 genset trip: Power gauge capacity drops 200->100 kW, Gensets pill shows 1.	"Committed 106.5 kW > 100 kW. Shed in declared order: G5 to 8 kW low-power (70 % capability lost); 69.5 kW, zero infeasible ticks. The forecast chip only advises (G5 feeder trend); it never changes a decision."
00:55-01:10	Priority ? D6 -> Run both profiles.	"Same code, same timeline, two ships: rescue holds G3 at T+08:00, lands G4 at T+14:15, survey loses 26 min."
01:10-01:30	Header Crew 14 -> 6 -> 0 (Shocks tab shows effect).	"14 crew: 30 s confirmation. 6: 120 s confirmation, deck occupied is infeasible and escalates. 0: recovery refused -- no hands on deck."
then	Jury test ? A: baseline G1+G2+G5, the jury's card (catalog or Paste card YAML/JSON), change one number (water 30 deg C, generators 1), Evaluate.	Verdict badge + one sentence, e.g. "Yes if G2 is throttled to CONTINUOUS_SENSING: otherwise electrical power binds (needs 101.5 kW, 100 kW available)", cheapest ways to say yes, placement, one-genset-down check, time vs 30 s budget.

Backup: recording welcome but does not replace the live run. Physical Account (1 page) and Scenario C memo are handed over before starting.
